**Araldite® AT 1-1**

**One component heat curing powdered epoxy adhesive**

### Key properties

- Cures at 120 - 200°C
- Long term heat resistance up to 110°C
- Good resistance to weathering and chemicals
- High resistance to static and dynamic stress

### Description

Araldite AT 1-1 is a one-component, heat-curable, epoxy adhesive in powder form for use in general industrial applications such as the bonding of abrasive and magnetic powders.

### Processing

**Pretreatment**

The strength and durability of a bonded joint are dependent on proper treatment of the surfaces to be bonded. At the very least, joint surfaces should be cleaned with a good degreasing agent such as acetone, trichloroethylene or proprietary degreasing agent in order to remove all traces of oil, grease and dirt. Alcohol, gasoline (petrol) or paint thinners should never be used. The strongest and most durable joints are obtained by either mechanically abrading or chemically etching (“pickling”) the degreased surfaces. Abrading should be followed by a second degreasing treatment.

**Application of adhesive**

Araldite AT 1-1 is sold at room temperature, highly viscous at 70 - 90°C, and a low viscosity liquid at 130 - 140°C. It is cured by prolonged heating at temperatures above 120°C.

The powdered adhesive can be sprinkled onto the cold joint surfaces, which are then heated briefly to melt the powder and ensure a thorough wetting of the surfaces. No matter how it has been applied, the layer of adhesive will solidify when it cools. The parts to be bonded can be assembled and the adhesive cured either immediately after application, or after several weeks. The recommended bondline thickness is 0.1mm. This is achieved by applying about 140 - 160g adhesive per square metre.

</tbody>
</table>

The cure temperatures normally used lie between 130 and 200°C. At 130 - 180°C there is no risk of breaking down the adhesive by exceeding the recommended cure times.

The figures shown in the table are minimum cure times and do not take into account the time needed to heat the material being bonded to the selected cure temperature. Shock curing temperatures of 200°C and above are feasible, but the correct times must be determined by preliminary tests since they will depend on the thermal conductivity of the materials to be bonded.

Typical cured properties

Unless otherwise stated, the figures given below were all determined by testing standard specimens made by lap-jointing 170 x 25 x 1.5 mm strips of aluminium alloy. The joint area was 12.5 x 25 mm in each case. The figures were determined with typical production batches using standard testing methods. They are provided solely as technical information and do not constitute a product specification.

Processing

Pretreatment

The strength and durability of a bonded joint are dependent on proper treatment of the surfaces to be bonded. At the very least, joint surfaces should be cleaned with a good degreasing agent such as acetone, trichloroethylene or proprietary degreasing agent in order to remove all traces of oil, grease and dirt. Alcohol, gasoline (petrol) or paint thinners should never be used.

The strongest and most durable joints are obtained by either mechanically abrading or chemically etching (“pickling”) the degreased surfaces. Abrading should be followed by a second degreasing treatment.

Application of adhesive

Araldite AT 1-1 is solid at room temperature, highly viscous at 70 - 90°C, and a low viscosity liquid at 130 - 140°C. It is cured by prolonged heating at temperatures above 120°C.

The powdered adhesive can be sprinkled onto the cold joint surfaces, which are then heated briefly to melt the powder and ensure a thorough wetting of the surfaces. No matter how it has been applied, the layer of adhesive will solidify when it cools. The parts to be bonded can be assembled and the adhesive cured either immediately after application, or after several weeks.

The recommended bondline thickness is 0.1mm. This is achieved by applying about 140 - 160g adhesive per square metre.

Handling precautions

Vantico products are generally quite harmless to handle provided that certain precautions normally taken when handling chemicals are observed. The uncured materials must not, for instance, be allowed to come into contact with foodstuffs or food utensils, and measures should be taken to prevent the uncured materials from coming in contact with the skin, since people with particularly sensitive skin may be affected. The wearing of impervious rubber or plastic gloves will normally be necessary; likewise the use of eye protection. The skin should be thoroughly cleansed at the end of each working period by washing with soap and warm water. The use of solvents is to be avoided. Disposable paper - not cloth towels - should be used to dry the skin.

Adequate ventilation of the working area is recommended. These precautions are described in greater detail in Vantico publication No. 24264/3/e Hygienic precautions for handling plastics products of Vantico and in the Vantico Material Safety Data sheets for the individual products. These publications are available on request.

Storage

Araldite AT 1-1 may be stored for up to 3 years at less than 18°C. The expiry date is indicated on the label. Storage at higher temperatures may cause sintering. Boxes should not be stacked more than 2 layers high.

Pretreatment

Hygienic precautions for handling plastics products of Vantico and in the Vantico Material Safety Data sheets for the individual products. These publications are available on request for fuller information.
